

# Supply Chain Analysis

## 1. Project Overview

This dataset acts as a Supply Chain Efficiency Monitor, providing a complete view of how products move from suppliers to customers while tracking time, inventory, and costs. It is structured around three key areas: logistics, which helps identify delays in processing and shipping; inventory, which ensures stock levels are balanced and highlights risks like shortages or overstocking; and financials, which evaluate overall profitability by analyzing sales and various costs. Together, these elements make the dataset a powerful diagnostic tool that helps identify inefficiencies, reduce costs, and improve overall business performance. The main goal is to understand how warehouses and product categories are performing by looking at inventory, demand, costs and risks. By cleaning and organizing the data, the project aims to convert raw data into meaningful insights.

## 2. Key Areas of Analysis

- **Inventory & Demand** → Compare available stock with demand forecast to spot shortages or excess.
- **Risk Metrics** → Track risks like stockouts, product returns, and damaged goods.
- **Cost Analysis** → Study operational, storage, and transport costs to control expenses.
- **Performance** → Measure monthly sales and net profit to check overall business health.
- **Customer Satisfaction** → Use ratings and return rates to understand customer experience.

## 3. Project Objectives

- **Clean the data** → Fix errors, remove duplicates, and prepare the dataset for analysis.
- **Study inventory vs demand** → Compare stock with demand forecast to spot shortages or surpluses.
- **Measure risks** → Track issues like stockouts, product returns, and damaged goods.

## 4. Dataset Summary

- The data has **500 rows** (warehouse records) and **20 columns** (details about each warehouse and products).
- It includes **warehouse details** like Warehouse ID, Location, and Employee Count.
- It tracks **inventory and demand**: Current Stock, Demand Forecast, Warehouse

Capacity, Backorder Quantity.

- It shows **risk metrics**: Stockout Risk, Damaged Goods, Return Rate, Customer Rating. It includes **financials**: Operational, Storage, Transportation Cost.

## 5. Exploratory Data Analysis using Python

- **Data Loading** → We opened the dataset in Python using the pandas library. This step makes the data ready to work with.
- **Initial Exploration** → We checked the basic structure of the dataset using `df.info()` to see number of rows, columns, and data types.
- **Summary Statistics** → We used `df.describe()` to quickly look at averages, minimums, maximums, and other statistics for the numeric columns.

```

## ▪ Feature Engineering →

- **Total Logistics Cost Column** → We combined operational, storage, and transportation costs into a single column. This gives a clear picture of the overall logistics expense instead of looking at separate cost components.
- **Net Profit Column** → We subtracted total logistics cost from monthly sales to calculate net profit. This helps identify whether warehouses or suppliers are profitable after covering all logistics expenses.
- **Operating Cost Ratio Column** → We divided total logistics cost by monthly sales to measure efficiency. A lower ratio means costs are well-managed compared to revenue, while a higher ratio signals inefficiency. This inefficiency can happen due to: Excessive Operational Costs (High labor), Storage Inefficiency (Paying for unused warehouse), and Transportation Issues (Expensive shipping routes).
- **Delivery Efficiency Column** → We added shipping time, order processing time, and lead time to capture the total delivery cycle. This metric highlights how quickly products move from order to delivery.
- **Stock Utilization Column** → We calculated the percentage of warehouse capacity being used by dividing current stock by total capacity. This shows whether storage space is underutilized or overloaded.
- **Inventory Turnover Ratio Column** → We divided monthly sales by current stock to measure how fast inventory is sold. A higher ratio indicates efficient stock movement, while a lower ratio suggests slow-moving goods.
- **Demand Gap Column** → We subtracted current stock from demand forecast to identify shortages or surpluses. **If the number is positive** → It means demand is higher than stock, so there's a **shortage**. **If the number is negative** → It means stock is more than demand, so there's a **surplus**.
- **Risk Score Column** → We added damaged goods, return rate, and stockout risk into one score. This score shows how **risky or unreliable** the supply chain is: If the score is **high**, it means there are more problems — like too many damaged items, customers returning products, or frequent stockouts and if the score is **low**, it means the supply chain is running smoothly with fewer issues.
- **New Features Grouping** → After creating several new metrics, we grouped them together into a single list. This makes it easier to focus only on the engineered KPIs instead of mixing them with the raw dataset fields.
- **Missing Value Check** → We checked how many null values exist in each new metric.
- **Summary Statistics** → We generated descriptive statistics (mean, median, min, max, quartiles) for the new metrics. This helps us understand the **distribution** of values.
- **Final Dataset Export** → We saved the dataset into a CSV file for further analysis and visualization. This ensures the dataset is clean, complete, and ready for reporting or dashboard creation.

**Total Logistics Cost : Total cost of all logistics operations -**

```
> ✓ df['Total_Logistics_Cost']=df['Operational_Cost']+df['Storage_Cost']+df['Transportation_Cost']  
[24] ✓ 0.0s
```

**Estimated Profit : Difference between monthly\_sales and total\_cost -**

```
> ✓ df['Net_Profit']=df['Monthly_Sales']-df['Total_Logistics_Cost']  
[11] ✓ 0.0s
```

**Calculate Operating Cost Ratio : This measures how much of sales revenue is consumed by logistics cost -**

```
> ✓ df['Operating_Cost_Ratio']=df['Total_Logistics_Cost']/df['Monthly_Sales']  
[12] ✓ 0.0s
```

**Delivery Efficiency : Total number of days taken for a customer to receive an order -**

```
> ✓ df['Delivery_Efficiency']=df['Shipping_Time_Days']+df['Order_Processing_Time']+df['Lead_Time_Days']  
[13] ✓ 0.0s
```

**Stock Utilization : Percentage of warehouse space being used-**

```
> ✓ df['Stock_Utilization']=(df['Current_Stock']/df['Warehouse_Capacity'])*100  
[14] ✓ 0.0s
```

**Inventory Turnover Ratio : A way to measure how many times items are sold out and restocked-**

```
> ✓ df['Inventory_Turnover_Ratio'] = df['Monthly_Sales'] / df['Current_Stock']  
[15] ✓ 0.0s
```

**Demand Gap : It shows how much more stock is needed-**

```
> ✓ df['Demand_Gap']=df['Demand_Forecast']-df['Current_Stock']  
[16] ✓ 0.0s
```

**Risk Score : It gives overall supply chain risk-**

```
> ✓ df['Risk_Score']=df['Damaged_Goods']+df['Return_Rate']+df['Stockout_Risk']
```

```

## 6. Data Analysis using SQL (Supply Chain Operations)

We performed structured analysis in PostgreSQL to answer key business questions:

- 1. Profit & Operating Cost Analysis** → Identified cities with negative profit (Loss) and checked if high logistics costs are affecting their overall cost efficiency ratio.

|    | location<br>character varying (50) | avg_net_profit<br>numeric | total_cost<br>numeric | avg_cost_ratio<br>numeric |

## 7. Dashboard in Power BI

Finally, we built an interactive dashboard in Power BI to present insights visually.

## 8. Business Recommendations

- **Cut Costs** → Try to spend less on transport, storage, and daily operations so profit goes up.
- **Deliver Faster** → Reduce waiting time by speeding up order handling and shipping. Customers will be happier.
- **Use Warehouse Space Better** → Don't keep warehouses too empty or too full. Balance stock so space is used wisely.
- **Sell Stock Quickly** → Move products faster with offers, bundles, or promotions. This avoids goods sitting too long.

- **Match Demand and Supply →** Keep enough stock to meet customer demand but avoid overstocking. Plan purchases carefully.
- **Lower Risks →** Reduce damaged goods, returns, and stockouts by improving packaging, quality checks, and backup stock.
- **Focus on Profitable Products →** Spend more effort on categories that sell well and give good profit, like electronics or apparel.
- **Check Discounts and Returns →** Make sure discounts increase sales without cutting too much profit. Also, reduce high return rates by improving product quality.
- **Train Employees →** Teach staff better ways to handle stock and orders. This saves time and reduces mistakes.
